

CrewAI: Multi-Agent Collaboration Framework

Overview of CrewAI CrewAI is a framework for orchestrating role-playing, autonomous AI agents. It enables agents to collaborate, share tasks, and delegate responsibilities to solve complex multi-step problems.

Fundamental Concepts - **Agent:** A structured LLM-powered entity with a specific Role, Goal, Backstory, and set of tools (e.g., search tools, file tools). - **Task:** A concrete assignment representing work to be done. Tasks have a description, expected output, and can be assigned to specific agents. - **Crew:** A collection of agents and tasks working together sequentially or hierarchically to achieve a objective.

Agent Memory and Delegation CrewAI supports short-term, long-term, and entity memory, allowing agents to retain context. Agents can also delegate tasks to other agents dynamically within a running Crew structure.
