

LangChain Framework Documentation

Overview of LangChain LangChain is an open-source framework designed to simplify the creation of applications using Large Language Models. It provides modular components, integrations, and unified interfaces to build complex chains and agents.

Core Elements

- 1. Model I/O:** Interfaces for working with Chat Models, LLMs, Prompts, and Output Parsers.
- 2. Retrieval:** Standardized tools to load documents (Document Loaders), split text (Text Splitters), generate vectors (Embeddings), and search databases (Vector Stores).
- 3. LangChain Expression Language (LCEL):** A declarative language for chaining components together using pipe operators (`|`), enabling out-of-the-box streaming and batching.
- 4. Chains and Memory:** Abstract workflows that combine multiple LLM steps, and memory variables to persist conversation history across user interactions.
