

OpenAI Developer API Documentation

Core Endpoints OpenAI provides APIs for model inference, text embeddings, image generation (DALL-E), and transcription (Whisper).

Chat Completions API The `/v1/chat/completions` endpoint processes conversation history (user, system, and assistant messages) and returns responses generated by GPT-4o, GPT-4o-mini, or specialized model variants.

Assistants API and Vector Search The Assistants API simplifies building agents by natively managing conversational state (Threads) and integrating file retrieval (File Search) and code execution (Code Interpreter) directly into the API runtime.
